Model Release Status

This model is released as part of OVP releases and is included in OVPworld packages. Please visit OVPworld.org.

Table Of Contents

1.0 Model Specific Information

This document provides usage information for an Imperas OVP peripheral behavioral model.

The document is split into sections providing specific information for this peripheral, including any ports for connecting into a platform, registers, other component parts, and configuration options and general information for peripheral modeling with Imperas OVP.

1.1 Description

Model of the UART peripheral used on the Freescale Kinetis platform

1.2 Limitations

Provides the base behaviour for the OVP Freescale Kinetis platforms

1.3 Reference

www.freescale.com/Kinetis

1.4 Licensing

Open Source Apache 2.0

1.5 Location

The KinetisUART peripheral model is located in an Imperas/OVP installation at the VLNV: freescale.ovpworld.org / peripheral / KinetisUART / 1.0.

2.0 Peripheral Instance Parameters

This model accepts the following parameters:

Table 1. Peripheral Parameters

Name	Type	Description
directReadWrite	bool	Enable the use of the DirectRead and DirectWrite connections
fifoSize	uns32	Size of fifos (default 128)
moduleClkFreq	uns32	Frequency (in hertz) of module clock used in baud rate calculation (default=10.2 MHz)
console	bool	If specified, port number is ignored, and a console pops up automatically
client	bool	If true, model is a client and will connect to portnum. If false, model is a server and will listen on portnum.
portnum	uns32	If set, listen on, or connect to, this port. If set to zero in listen mode, allocate a port from the pool and listen on that.
hostname	string	Name (or IP address) of host to connect to. Valid if listen=true
infile	string	Name of file to use for device source
outfile	string	Name of file to write device output
portFile	string	If portnum was specified as zero, write the port

		number to this file when it's known
log	bool	If specified, serial output will go to simulator log
finishOnDisconnect	bool	If set, disconnecting the port will cause the simulation to finish
connectnonblocking	bool	If set, simulation can begin before the connection is made
xchars	uns32	Width of console in characters
ychars	uns32	Height of console in characters
record	string	Record external events into this file
replay	string	Replay external events from this file

3.0 Net Ports

This model has the following net ports:

Table 2. Net Ports

Name	Type	Must Be Connected	Description
DirectWrite	output	F (False)	
DirectRead	input	F (False)	
Interrupt	output	F (False)	
Reset	input	F (False)	

4.0 Bus Slave Ports

This model has the following bus slave ports:

4.1 Bus Slave Port: bport1

Table 3. Bus Slave Port: bport1

Name	Size (bytes)	Must Be Connected	Description
bport1	0x1000	F (False)	

Table 4. Bus Slave Port: bport1 Registers:

Name	Offset	Width (bits)	Description	R/W	is Volatile
ab_BDH	0x0	8	UART Baud Rate Registers:High, offset: 0x0		
ab_BDL	0x1	8	UART Baud Rate Registers: Low, offset: 0x1		
ab_C1	0x2	8	UART Control Register 1, offset: 0x2		
ab_C2	0x3	8	UART Control Register 2, offset: 0x3		
ab_S1	0x4	8	UART Status Register 1, offset: 0x4		
ab_S2	0x5	8	UART Status Register 2, offset: 0x5		
ab_C3	0x6	8	UART Control Register 3, offset: 0x6		
ab_D	0x7	8	UART Data Register, offset: 0x7		

ab_MA1	0x8	8	UART Match Address Registers 1, offset: 0x8		
ab_MA2	0x9	8	UART Match Address Registers 2, offset: 0x9		
ab_C4	0xa	8	UART Control Register 4, offset: 0xA		
ab_C5	0xb	8	UART Control Register 5, offset: 0xB		
ab_ED	0xc	8	UART Extended Data Register, offset: 0xC		
ab_MODEM	0xd	8	UART Modem Register, offset: 0xD		
ab_IR	0xe	8	UART Infrared Register, offset: 0xE		
ab_PFIFO	0x10	8	UART FIFO Parameters, offset: 0x10		
ab_CFIFO	0x11	8	UART FIFO Control Register, offset: 0x11		
ab_SFIFO	0x12	8	UART FIFO Status Register, offset: 0x12		
ab_TWFIFO	0x13	8	UART FIFO Transmit Watermark, offset: 0x13		
ab_TCFIFO	0x14	8	UART FIFO Transmit Count, offset: 0x14		
ab_RWFIFO	0x15	8	UART FIFO Receive Watermark, offset: 0x15		
ab_RCFIFO	0x16	8	UART FIFO Receive Count, offset: 0x16		
ab_C7816	0x18	8	UART 7816 Control Register, offset: 0x18		
ab_IE7816	0x19	8	UART 7816 Interrupt Enable Register, offset: 0x19		
ab_IS7816	0x1a	8	UART 7816 Interrupt Status Register, offset: 0x1A		
ab_WP7816T0	0x1b	8	UART 7816 Wait Parameter Register, offset: 0x1B		
ab_WN7816	0x1c	8	UART 7816 Wait N Register, offset: 0x1C		
ab_WF7816	0x1d	8	UART 7816 Wait FD Register, offset: 0x1D		
ab_ET7816	0x1e	8	UART 7816 Error Threshold Register, offset: 0x1E		
ab_TL7816	0x1f	8	UART 7816 Transmit Length Register, offset: 0x1F		
ab_C6	0x21	8	UART CEA709.1-B Control Register 6, offset: 0x21		
ab_PCTH	0x22	8	UART CEA709.1-B Packet Cycle Time Counter High, offset: 0x22		

ab_PCTL	0x23	8	UART CEA709.1-B Packet Cycle Time Counter Low, offset: 0x23		
ab_B1T	0x24	8	UART CEA709.1-B Beta1 Timer, offset: 0x24		
ab_SDTH	0x25	8	UART CEA709.1-B Secondary Delay Timer High, offset: 0x25		
ab_SDTL	0x26	8	UART CEA709.1-B Secondary Delay Timer Low, offset: 0x26		
ab_PRE	0x27	8	UART CEA709.1-B Preamble, offset: 0x27		
ab_TPL	0x28	8	UART CEA709.1-B Transmit Packet Length, offset: 0x28		
ab_IE	0x29	8	UART CEA709.1-B Interrupt Enable Register, offset: 0x29		
ab_WB	0x2a	8	UART CEA709.1-B WBASE, offset: 0x2A		
ab_S3	0x2b	8	UART CEA709.1-B Status Register, offset: 0x2B		
ab_S4	0x2c	8	UART CEA709.1-B Status Register, offset: 0x2C		
ab_RPL	0x2d	8	UART CEA709.1-B Received Packet Length, offset: 0x2D		
ab_RPREL	0x2e	8	UART CEA709.1-B Received Preamble Length, offset: 0x2E		
ab_CPW	0x2f	8	UART CEA709.1-B Collision Pulse Width, offset: 0x2F		
ab_RIDT	0x30	8	UART CEA709.1-B Receive Indeterminate Time, offset: 0x30		
ab_TIDT	0x31	8	UART CEA709.1-B Transmit Indeterminate Time, offset: 0x31		

5.0 Platforms that use this peripheral component

Peripheral components can be used in many different platforms, including those developed by Imperas or by other users of OVP. You can use this peripheral in your own platforms.

Table 5. Publicly available platforms using peripheral 'KinetisUART'

Platform Name	Vendor
FreescaleKinetis60	freescale.ovpworld.org
FreescaleKinetis64	freescale.ovpworld.org

7.0 General Information on Peripheral Models

This document provides usage information for an Imperas OVP peripheral behavioral model.

The document is split into sections providing specific information for this peripheral, including any ports for connecting into a platform, registers etc. and configuration options and general information for peripheral modeling with Imperas OVP.

7.1 Background

Imperas OVP simulation technology enables very high performance simulation, debug and analysis of platforms containing multiple processors and peripheral models. The technology is designed to be extensible: you can create new models of processors, peripherals and other platform components using interfaces and libraries defined by OVP.

The peripheral models created using the OVP APIs run on the Peripheral Simulation Engine (PSE).

The model is typically written in C and compiled into an executable for the PSE processor architecture. The model is compiled for speed of execution and to protect IP. It is dynamically loaded by the simulator at run time.

8.0 Building peripherals easily with Imperas iGen

To aid with model creation, Imperas products include iGen, a model generation tool. iGen takes the laborious and error-prone task of constructing the various hardware model and software element files required for a typical model, and automates this process. iGen creates the needed C files. iGen also creates the C++ SystemC TLM2 interface files needed to run peripheral models in SystemC simulations.

iGen takes as input a simple script specification that includes device internals such as registers and memories, port information, component descriptors, and other elements. iGen then builds the C code model files and user editable templates. These include model frameworks with registers, function calls, memory map, and other items. It ensures that all component parts of the model are well-structured using best practices, and are consistent throughout the files, thus eliminating a common source of errors.

More information on iGen can be found: imperas.com/products.

9.0 Peripheral model internals

Each instance of a peripheral model runs on its own virtual machine with an address space large enough for the model. This processor (the PSE) and its memory are separate from any processors, memories and buses in the platform being simulated; they exist only to execute the code of the peripheral model.

Interception of functions defined in the peripheral model allows the use of features of the host system in the

implementation of the behavior of a peripheral. As an example, a real platform might contain a video display device. When simulating this system, it is generally more convenient not to simulate the complete video display device but to use a video package available on the host machine, such as SDL, and to use this to render to the host display. Also models of uarts, ethernet devices and USB components can make use of the host PC resources during simulation, to allow, for example, a simulation to browse the real internet, or the simulation to connect to a real USB device.

10.0 Parts of peripheral models

10.1 Configuring the Peripheral Instance with Parameters

A peripheral can include the behaviour of several configurations. These are controlled when the peripheral is instanced in the platform by setting parameters defined on the peripheral.

10.2 Net Ports

Peripherals may be connected to other peripherals or processors with signal wires (nets). These can be used to act as interrupt signals or used to control behavior between peripherals.
The wires are created in the platform as nets and this net is connected into the peripheral using a net port.

10.3 Bus master ports

A bus master port initiates (and controls the address of) a bus cycle. Bus cycles are generated by behavioral code within the peripheral model.

10.4 Bus slave ports

A peripheral can be defined as having several bus slave ports. The bus slave ports can be split into several address blocks. Each address block be either local memory or memory mapped registers. Both of these can have associated callback functions. A memory mapped register can also be defined as specific read/write access, whether it is volatile, and also whether it is associated with a reset pin and mask. A memory mapped register can also have specific bit fields defined.

10.5 Packetnets

A peripheral can be defined as being connected to packetnet ports. A packetnet is used to model packet based communication such as Ethernet, CAN bus or GSM. A packetnet is created in a platform, then connected to packetnet ports on model instances. A packetnet can have many connections, each able to send or receive packets. A packetnet is used as an efficient method of communication within OVP models.

For more information on modeling with packetnets, please see the peripheral modeling documentation: OVP_Peripheral_Modeling_Guide.pdf, OVPsim_and_CpuManager_User_Guide.pdf and the example: $IMPERAS_HOME/Examples/Models/Peripherals/packetnet.

11.0 More information (documentation) on peripheral models and modeling

More information on modeling and APIs can be found at: OVPworld.org/technology_apis.

Specifics on modeling peripherals can be found: OVP_Peripheral_Modeling_Guide.pdf.

A full list of the currently available OVP documentation is available: OVPworld.org/documentation.
