Model Release Status

This model is released as part of OVP releases and is included in OVPworld packages. Please visit OVPworld.org.

Table Of Contents

1.0 Model Specific Information

This document provides usage information for an Imperas OVP peripheral behavioral model.

The document is split into sections providing specific information for this peripheral, including any ports for connecting into a platform, registers, other component parts, and configuration options and general information for peripheral modeling with Imperas OVP.

1.1 Description

iMX6 UART

1.2 Licensing

Open Source Apache 2.0

1.3 Limitations

This is an incomplete model of the UART.

It has basic functionality to support the iMX6 platform, Rx and Tx of data only.

There is no modeling of physical aspects of the UART, such as baud rates etc.

1.4 Reference

i.MX 6Solo/6DualLite Applications Processor Reference Manual (IMX6SDLRM_Ref_Manual.pdf

1.5 Location

The iMX6_UART peripheral model is located in an Imperas/OVP installation at the VLNV: nxp.ovpworld.org / peripheral / iMX6_UART / 1.0.

2.0 Peripheral Instance Parameters

This model accepts the following parameters:

Table 1. Peripheral Parameters

Name	Type	Description
charmode	bool	
console	bool	If specified, port number is ignored, and a console pops up automatically
client	bool	If true, model is a client and will connect to portnum. If false, model is a server and will listen on portnum.
portnum	uns32	If set, listen on, or connect to, this port. If set to zero in listen mode, allocate a port from the pool and listen on that.
hostname	string	Name (or IP address) of host to connect to. Valid if listen=true
infile	string	Name of file to use for device source
outfile	string	Name of file to write device output

portFile	string	If portnum was specified as zero, write the port number to this file when it's known
log	bool	If specified, serial output will go to simulator log
finishOnDisconnect	bool	If set, disconnecting the port will cause the simulation to finish
connectnonblocking	bool	If set, simulation can begin before the connection is made
xchars	uns32	Width of console in characters
ychars	uns32	Height of console in characters
record	string	Record external events into this file
replay	string	Replay external events from this file

3.0 Net Ports

This model has the following net ports:

Table 2. Net Ports

Name	Type	Must Be Connected	Description
irq	output	F (False)	

4.0 Bus Slave Ports

This model has the following bus slave ports:

4.1 Bus Slave Port: bport1

Table 3. Bus Slave Port: bport1

Name	Size (bytes)	Must Be Connected	Description
bport1	0x4000	T (True)	

Table 4. Bus Slave Port: bport1 Registers:

Name	Offset	Width (bits)	Description	R/W	is Volatile
ab_UART_URXD	0x0	32	UART Receiver Register (UART_URXD)		
ab_UART_UTXD	0x40	32	Description UART Transmitter Register (UART_UTXD)		
ab_UART_UCR1	0x80	32	UART Control Register 1 (UART_UCR1)		
ab_UART_UCR2	0x84	32	UART Control Register 2 (UART_UCR2)		
ab_UART_UCR3	0x88	32	UART Control Register 3 (UART_UCR3)		
ab_UART_UCR4	0x8c	32	UART Control Register 4 (UART_UCR4)		
ab_UART_UFCR	0x90	32	UART FIFO Control Register (UART_UFCR)		
ab_UART_USR1	0x94	32	Description UART Status Register 1 (UART_USR1) Transmitter Ready Interrupt Receiver Ready Interrupt Receiver Idle		

ab_UART_USR2	0x98	32	UART Status Register 2 (UART_USR2)		
ab_UART_UESC	0x9c	32	UART Escape Character Register (UART_UESC)		
ab_UART_UTIM	0xa0	32	UART Escape Timer Register (UART_UTIM)		
ab_UART_UBIR	0xa4	32	UART BRM Incremental Register (UART_UBIR)		
ab_UART_UBMR	0xa8	32	UART BRM Modulator Register (UART_UBMR)		
ab_UART_UBRC	0xac	32	UART Baud Rate Count Register (UART_UBRC)		
ab_UART_ONEMS	0xb0	32	UART One Millisecond Register (UART_ONEMS		
ab_UART_UTS	0xb4	32	UART Test Register (UART_UTS)		
ab_UART_UMCR	0xb8	32	UART RS-485 Mode Control Register (UART_UMCR)		

5.0 Platforms that use this peripheral component

Peripheral components can be used in many different platforms, including those developed by Imperas or by other users of OVP. You can use this peripheral in your own platforms.

Table 5. Publicly available platforms using peripheral 'iMX6_UART'

Platform Name	Vendor
iMX6S	nxp.ovpworld.org

7.0 General Information on Peripheral Models

This document provides usage information for an Imperas OVP peripheral behavioral model.

The document is split into sections providing specific information for this peripheral, including any ports for connecting into a platform, registers etc. and configuration options and general information for peripheral modeling with Imperas OVP.

7.1 Background

Imperas OVP simulation technology enables very high performance simulation, debug and analysis of platforms containing multiple processors and peripheral models. The technology is designed to be extensible: you can create new models of processors, peripherals and other platform components using interfaces and libraries defined by OVP.

The peripheral models created using the OVP APIs run on the Peripheral Simulation Engine (PSE).

The model is typically written in C and compiled into an executable for the PSE processor architecture. The model is compiled for speed of execution and to protect IP. It is dynamically loaded by the simulator at run time.

8.0 Building peripherals easily with Imperas iGen

To aid with model creation, Imperas products include iGen, a model generation tool. iGen takes the laborious and error-prone task of constructing the various hardware model and software element files required for a typical model, and automates this process. iGen creates the needed C files. iGen also creates the C++ SystemC TLM2 interface files needed to run peripheral models in SystemC simulations.

iGen takes as input a simple script specification that includes device internals such as registers and memories, port information, component descriptors, and other elements. iGen then builds the C code model files and user editable templates. These include model frameworks with registers, function calls, memory map, and other items. It ensures that all component parts of the model are well-structured using best practices, and are consistent throughout the files, thus eliminating a common source of errors.

More information on iGen can be found: imperas.com/products.

9.0 Peripheral model internals

Each instance of a peripheral model runs on its own virtual machine with an address space large enough for the model. This processor (the PSE) and its memory are separate from any processors, memories and buses in the platform being simulated; they exist only to execute the code of the peripheral model.

Interception of functions defined in the peripheral model allows the use of features of the host system in the

implementation of the behavior of a peripheral. As an example, a real platform might contain a video display device. When simulating this system, it is generally more convenient not to simulate the complete video display device but to use a video package available on the host machine, such as SDL, and to use this to render to the host display. Also models of uarts, ethernet devices and USB components can make use of the host PC resources during simulation, to allow, for example, a simulation to browse the real internet, or the simulation to connect to a real USB device.

10.0 Parts of peripheral models

10.1 Configuring the Peripheral Instance with Parameters

A peripheral can include the behaviour of several configurations. These are controlled when the peripheral is instanced in the platform by setting parameters defined on the peripheral.

10.2 Net Ports

Peripherals may be connected to other peripherals or processors with signal wires (nets). These can be used to act as interrupt signals or used to control behavior between peripherals.
The wires are created in the platform as nets and this net is connected into the peripheral using a net port.

10.3 Bus master ports

A bus master port initiates (and controls the address of) a bus cycle. Bus cycles are generated by behavioral code within the peripheral model.

10.4 Bus slave ports

A peripheral can be defined as having several bus slave ports. The bus slave ports can be split into several address blocks. Each address block be either local memory or memory mapped registers. Both of these can have associated callback functions. A memory mapped register can also be defined as specific read/write access, whether it is volatile, and also whether it is associated with a reset pin and mask. A memory mapped register can also have specific bit fields defined.

10.5 Packetnets

A peripheral can be defined as being connected to packetnet ports. A packetnet is used to model packet based communication such as Ethernet, CAN bus or GSM. A packetnet is created in a platform, then connected to packetnet ports on model instances. A packetnet can have many connections, each able to send or receive packets. A packetnet is used as an efficient method of communication within OVP models.

For more information on modeling with packetnets, please see the peripheral modeling documentation: OVP_Peripheral_Modeling_Guide.pdf, OVPsim_and_CpuManager_User_Guide.pdf and the example: $IMPERAS_HOME/Examples/Models/Peripherals/packetnet.

11.0 More information (documentation) on peripheral models and modeling

More information on modeling and APIs can be found at: OVPworld.org/technology_apis.

Specifics on modeling peripherals can be found: OVP_Peripheral_Modeling_Guide.pdf.

A full list of the currently available OVP documentation is available: OVPworld.org/documentation.
