### Overview

This document provides the details of an OVP Fast Processor Model variant.

OVP Fast Processor Models are written in C and provide a C API for use in C based platforms. The models also provide a native interface for use in SystemC TLM2 platforms.

The models are written using the OVP VMI API that provides a Virtual Machine Interface that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance. Most models are provided as a binary shared object and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model.

The models are run through an extensive QA and regression testing process and most model families are validated using technology provided by the processor IP owners. There is a companion document (OVP Guide to Using Processor Models) which explains the general concepts of OVP Fast Processor Models and their use. It is downloadable from the OVPworld website documentation pages.

### 1.5 ConfigurationFeatures

#### 1.6 Verification

Models have been validated correct by running through extensive tests using test suites and technology provided by Xilinx

## Configuration

#### 2.1 Location

This model's VLNV is xilinx.ovpworld.org/processor/microblaze/1.0.

The model source is usually at:

\$IMPERAS\_HOME/ImperasLib/source/xilinx.ovpworld.org/processor/microblaze/1.0

The model binary is usually at:

\$IMPERAS\_HOME/lib/\$IMPERAS\_ARCH/ImperasLib/xilinx.ovpworld.org/processor/microblaze/1.0

#### 2.2 GDB Path

The default GDB for this model is: \$IMPERAS\_HOME/lib/\$IMPERAS\_ARCH/gdb/microblaze-xilinx-elf-gdb.

### 2.3 Semi-Host Library

The default semi-host library file is xilinx.ovpworld.org/semihosting/microblazeNewlib/1.0

#### 2.4 Processor Endian-ness

This model can be set to either endian-ness (normally by a pin, or the ELF code).

### 2.5 QuantumLeap Support

This processor is qualified to run in a QuantumLeap enabled simulator.

#### 2.6 Processor ELF code

ELF codes supported by this model are:0xbd and 0xbaab.

### Hierarchy of the model

A CPU core may be configured to instance many processors of a Symmetrical Multi Processor (SMP). A CPU core may also have sub elements within a processor, for example hardware threading blocks.

OVP processor models can be written to include SMP blocks and to have many levels of hierarchy. Some OVP CPU models may have a fixed hierarchy, and some may be configured by settings in a configuration register. Please see the register definitions of this model.

This model documentation shows the settings and hierarchy of the default settings for this model variant.

#### 11.1 Level 1

This level in the model hierarchy has 3 commands.

This level in the model hierarchy has 3 register groups:

Group name	Registers
User	32
System	25
Integration_support	1

Table 11.1: Register groups

This level in the model hierarchy has no children.

### **Model Commands**

A Processor model can implement one or more **Model Commands** available to be invoked from the simulator command line, from the OP API or from the Imperas Multiprocessor Debugger.
